

IN THE CLAIMS:

Please cancel claim 15 without prejudice.

Please amend claims 18-20 as follows:

1-15. (Canceled)

16. (Previously Presented) An integrated circuit of the type having metallization levels separated by dielectric layers and metallized vias connecting lines of different metallization levels, said integrated circuit comprising:

at least first and second metallization levels;

at least first and second superposed dielectric layers located above the first metallization level;

a third dielectric layer located above the first and second dielectric layers;

at least one electrical connection element provided in the third dielectric layer and passing through the second dielectric layer until it comes into contact with the first dielectric layer; and

at least one metallized via having an upper surface that is flush with an upper surface of the second dielectric layer.

17. (Original) The integrated circuit as defined in claim 16,

wherein the metallized via has a lateral surface adjacent to its upper surface, and

the electrical connection element includes one portion that is in contact with the upper surface of the metallized via and another portion at the level of the second dielectric layer that is in contact with the lateral surface of the metallized via.

18. (Currently Amended) The integrated circuit as defined in claim ~~[[15]]~~ 20, further comprising:

- a third metallization level;
- at least fourth and fifth superposed dielectric layers located above the second metallization level;
- a sixth dielectric layer located above the fourth and fifth dielectric layers; and
- at least one additional electrical connection element provided in the sixth dielectric layer and passing through the fifth dielectric layer until it comes into contact with the fourth dielectric layer.

19. (Currently Amended) The integrated circuit as defined in claim 18, ~~further comprising:~~
~~at least one additional metallized via having an upper surface that is flush with an upper surface of the second dielectric layer;~~

- wherein the metallized via has a lateral surface adjacent to its upper surface, and
- the electrical connection element includes one portion that is in contact with the upper surface of the metallized via and another portion at the level of the second dielectric layer that is in contact with the lateral surface of the metallized via.

20. (Currently Amended) ~~The~~ An integrated circuit ~~as defined in claim 15, further of the type having metallization levels separated by dielectric layers and metallized vias connecting lines of different metallization levels, said integrated circuit comprising:~~

- at least first and second metallization levels;
- at least first and second superposed dielectric layers located above the first metallization level, the first dielectric layer being located on the first metallization level;
- a third dielectric layer located above the first and second dielectric layers;
- at least one electrical connection element provided in the third dielectric layer and passing through the second dielectric layer until it comes into contact with the first dielectric layer; and
- at least one metallized via having an upper surface that is flush with an upper surface of the second dielectric layer.

21. (Previously Presented) The integrated circuit as defined in claim 20, wherein the metallized via has a lateral surface adjacent to its upper surface, and the electrical connection element includes one portion that is in contact with the upper surface of the metallized via and another portion at the level of the second dielectric layer that is in contact with the lateral surface of the metallized via.
22. (Previously Presented) The integrated circuit as defined in claim 18, wherein the fourth dielectric layer is located on the second metallization level.
23. (Previously Presented) An integrated circuit of the type having metallization levels separated by dielectric layers and metallized vias connecting lines of different metallization levels, said integrated circuit comprising:
- at least first and second metallization levels;
 - at least first and second superposed dielectric layers located above the first metallization level;
 - a third dielectric layer located above the first and second dielectric layers;
 - at least one electrical connection element provided in the third dielectric layer and passing through the second dielectric layer until it comes into contact with the first dielectric layer;
 - a third metallization level;
 - at least fourth and fifth superposed dielectric layers located above the second metallization level;
 - a sixth dielectric layer located above the fourth and fifth dielectric layers;
 - at least one additional electrical connection element provided in the sixth dielectric layer and passing through the fifth dielectric layer until it comes into contact with the fourth dielectric layer; and
 - at least one additional metallized via having an upper surface that is flush with an upper surface of the second dielectric layer.

24. (Previously Presented) The integrated circuit as defined in claim 23,
wherein the metallized via has a lateral surface adjacent to its upper surface, and
the electrical connection element includes one portion that is in contact with the upper
surface of the metallized via and another portion at the level of the second dielectric layer that is
in contact with the lateral surface of the metallized via.
25. (Previously Presented) The integrated circuit as defined in claim 23, wherein the fourth
dielectric layer is located on the second metallization level.
